

A)

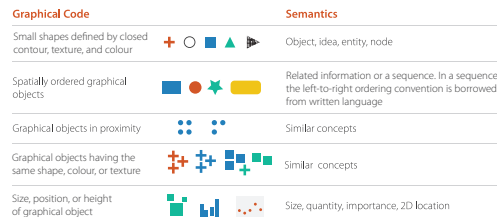

Given some data type, what retinal variable is most suitable?

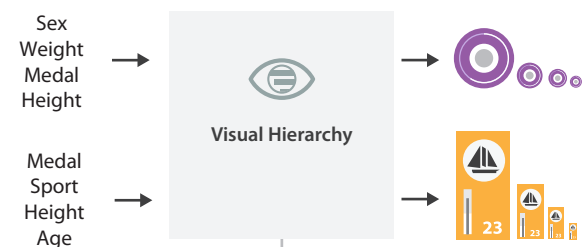

B)

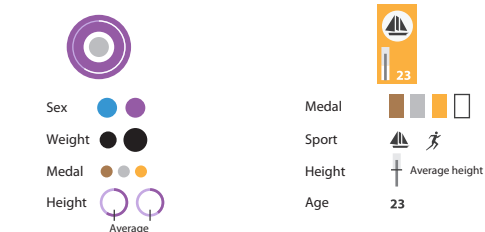

Is there a metaphoric or other natural mapping for this data?

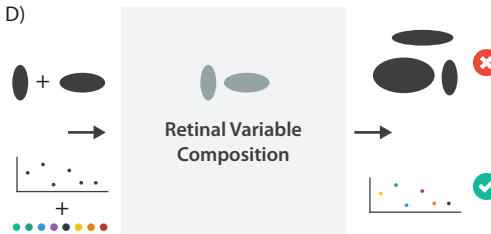

C)

How should I construct a glyph given some data types and their importance to the tasks?

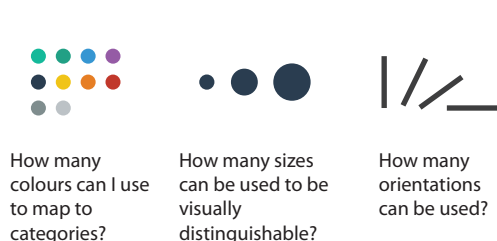

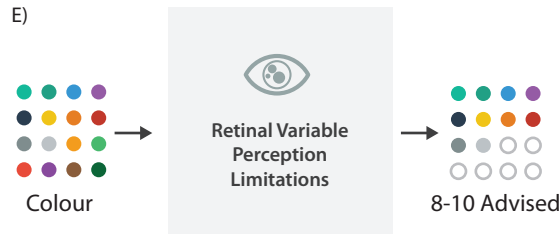

D)

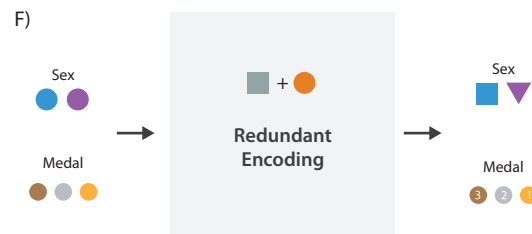

Which retinal variables can be used together, and which should not?

E)

F)

Using redundant encodings will decrease the likelihood of a user making a mistake in interpretation. Black and white print outs will impair colour codings. With the addition of shape, the item can still be perceived.
